CORE STACK

Java · Kotlin · Spring Boot
Node.js · TypeScript · NestJS · Micronaut
REST APIs · Distributed Systems
Batch Processing · Schedulers

DATA & PLATFORM

Oracle · PostgreSQL · MongoDB · Firebase
AWS · Docker · Kubernetes
OpenShift · GLUON · GitHub Actions
Apigee · Control-M · Flyway

AI-ASSISTED ENGINEERING

OpenAI Codex
GitHub Copilot
Devin AI
Prompt design · Agent workflows

SELECTED TOOLS

Python scripting · Kibana · Grafana · Confluence
Jira · SonarQube · JaCoCo
Resilience4j · Testcontainers
Jetpack Compose

LANGUAGES

Spanish - Native
English - C1
Professional proficiency
Russian - A2
Conversational proficiency

GIULIANO TESTINO

BACKEND SOFTWARE ENGINEER

Java · Kotlin · Spring Boot · Distributed Systems · AI-Native Development

PROFILE

Backend Software Engineer with 7+ years of experience building banking, logistics, card-processing, and customer-facing systems with Java, Kotlin, Spring Boot, Node.js and distributed architectures. Skilled in backend services, resilient batch processing, REST APIs, BFFs, data integration, CI/CD, cloud platforms, and observability. Designed and built Reals, an independent Android software project spanning backend, Android, Firebase, and AWS.

SELECTED ACHIEVEMENTS

NATIONWIDE OPERATIONS AUTOMATION Automated a daily workflow handling ~800 cards destroyed at branches, enabling digital reprint requests and routing unresolved cases through S3, Control-M, and RPA.

QUARTERLY MVP Developed a dedicated backend gateway for Pago Fácil and Rapipago pickup operations and integrated the new correspondent flow across six essential services.

FIRST GLUON GREENFIELD Launched the area's first greenfield Kotlin/Spring Boot service under GLUON; it later became a deployment reference for other teams.

END-TO-END PRODUCT Designed and built Reals, a pre-production Android dating app, across backend, Android, Firebase, and AWS, validating complete multi-user flows in a hosted development environment.

EXPERIENCE

SANTANDER TECNOLOGIA ARGENTINA

Software Engineer | Mar 2022 - Jun 2026

- Maintained and evolved a nationwide distributed backend ecosystem for card logistics and digital banking, combining Apigee-secured OAuth 2.0 APIs, asynchronous jobs, batch file processing, three Oracle databases, and multiple MongoDB stores.
- Designed and automated a daily workflow that blocked approximately 800 cards destroyed at branches, integrated card and customer services, classified Prisma failures, scheduled retries, and routed unresolved cases through S3 and Control-M to an external RPA.
- Created a scheduled push-notification service that queried multiple domain services, processed up to approximately 2,000 delivery candidates, sent around 400 activation reminders per daily run on a seven-day cadence, and persisted campaign state to prevent duplicates and analyze subsequent activations.
- Developed a dedicated backend gateway for Pago Fácil and Rapipago pickup operations and integrated the correspondent flow across six essential services of the card delivery platform; the initiative received quarterly MVP recognition.

BACKGROUND

EDUCATION

University of Buenos Aires

Electronic Engineering

Signal Processing focus

2013 - 2020

Python · MATLAB · Octave

COURSES

Advanced Object-Oriented Software Design I

10Pines

Advanced Object-Oriented Software Design II

10Pines

SOLID Principles and Clean Code

Udemy

Hexagonal Architecture with Spring Boot

EXPERIENCE, CONTINUED

SANTANDER TECNOLOGIA ARGENTINA · CONTINUED

Software Engineer | Mar 2022 - Jun 2026

- Launched the first greenfield Kotlin and Spring Boot service in the area under GLUON, integrating GitHub Actions, Kubernetes, OpenShift, S3, Control-M, and RPA; the implementation later served as a deployment reference for several teams.
- Contributed to a year-long brownfield migration to GLUON, moving applications from GitLab and Dumbo to GitHub-based workflows, OAM-managed versions, and controlled OpenShift deployments while continuing feature development and application maintenance.
- Maintained Node.js/TypeScript BFFs for 3 years and implemented the core endpoints of a NestJS BFF that modernized a legacy cardless-withdrawal flow across account, card, risk, withdrawal, and notification services.

CERTANT

Full Stack Developer | Apr 2019 - Feb 2022

- Delivered end-to-end corporate banking functionality for Itau Uruguay across legacy Java 4/7 applications using Java, JavaScript, jQuery, Oracle, Maven, XML-based integrations, and manually deployed WAR packages.
- Implemented multi-stage financial workflows covering validation, roles, approvals, guarantees, back-office operations, and external payment integrations, including 3scale-mediated services.
- Improved high-volume screens through query, retrieval, and pagination optimizations while adapting heterogeneous provider rules and changing business requirements.
- Became a primary technical and functional reference within a reduced team, trained new developers, and contributed backend work to a Java 8 service-oriented banking platform for Banco Comafi.

SELECTED PROJECT

REALS

Independent Software Project | 2026

Backend deployed and validated on AWS · Android release in preparation

- Designed and built a pre-production Android dating product centered on compatibility, text-first interaction, progressive profile reveal, staged conversations, and user-safety workflows, defining product behavior and technical direction across two repositories and three isolated environments.
- Engineered a Kotlin and Spring Boot backend on Java 21 and a Kotlin and Jetpack Compose Android app covering authentication, profiles, matchmaking, staged chats, text and audio messaging, visual decisions, scheduling, attendance, no-show, and account security.
- Deployed and validated the backend in an AWS development environment with GitHub Actions OIDC, SSM, EC2, Docker, private RDS PostgreSQL, and private S3 storage, testing complete multi-user flows from Android.
- Established an AI-native workflow based on scoped specifications, OpenAI Codex and other agents, architecture and diff review, focused testing, canonical documentation, and coordinated backend-Android changes.
